

## Tire not centered or axle too big

When you are behind the trainer, then the right part can be adjusted to fit the trainer better when the tire is not centered. This can also be used for 12mm axles that are longer than the standard.

To fit your axle, you can turn the right part to the left or right to center it better.

Please make sure you turn the blue nut fixed. This will prevent it from getting loose.

If the axle you have (like 12mm) is too big, then you can do the following

1. First take out the complete bolt and remove the blue fixing nut
2. Put the bolt back and keep turning until the blue side plastic gets out
3. Now you can also fix it with the blue nut
